

# High Pressure Dryer

## Full retrofit of cartridges

**SECURUS** (BAUER KOMPRESSOREN)

End of waste

## Former cartridges Securus

are disposable desiccant compressed air dryers located at discharge side of HP compressor such as Verticus 3 - 6 (BAUER).

Generally, the system contains two cartridges, one enables scanning of output air dryness. After the limit value is exceeded, alarm is activated and cartridges must be replaced.

In order to avoid wasteful operation with these disposable dryers we developed cartridges whose content can be easily and repeatedly replaced. We used stainless steel for the housing, instead of original aluminium. This will also achieve a high utility value.

New stainless steel cartridges are 100% dimensionally and functionally compatible with existing systems Bauer. For the users, this solution brings cheaper and more effective compressed air treatment immediately.

Based on more than 20-year experience, only premium fresh desiccants are used. The cartridges are packed in vacuum foils and supplied in heavy duty plastic tubes.

Preferably it is recommended to perform desiccant regeneration by exchange manner, i.e. wet cartridge is sent to refill and immediately returned back the user. In the case of higher system capacities it is possible to use more cartridges to be used in parallel: some of them are purifying the air and rest of them are retrofitted at the same time.
